MODEL PHYSICS TO CALCULATE THE THERMAL BUCKLING OF A THIN ECO-CONCRETE PANEL REINFORCED BY COW BONES

Abdelmoutalib BENFRID Mohamed BACHIR BOUIADJRA Mohammed CHATBI Zouaoui Rabie HARRAT Abdeldjalil BENBAKHTI **Published on: 9 June 2024**

Abstract

In the distant past, humans harnessed the skeletal remains of animals to shape their environment. Cow bones, known for their exceptional strength that persists beyond death, slowly decompose over time. Building on this concept, we will explore the thermal buckling characteristics of a concrete slab. By incorporating crushed bovine bone particles after homogenization, in line with the principles of physical aim to energy conservation, we determine the highest temperature at which thermal buckling occurs. This study seeks to understand the thermal behaviour of buckling in concrete

plates. Moreover, the widespread local consumption of cows encourages the recycling of bones from commonly eaten animals, aiming to reduce waste from homes and meat markets, lower the risk of harmful bacteria, and investigate potential future uses for these bones. Replacing fine sand with cow bone powder could benefit the and mining sectors by economy reducing environmental damage. Developing new. efficient, а environmentally friendly concrete marks a step forward in exploring alternative materials in concrete research. Mining not only helps conserve natural resources but also supports the global effort toward environmental preservation and a green economy. Cow bone powder offers concrete significant benefits, promoting a sustainable method to integrate waste recycling into concrete production.

Keywords: Cow Bone Powder, Panel, Thermal Buckling, Eco-friendly concrete.

* Introduction

This study delves into the thermal buckling instability of plates made from a novel composite material, specifically concrete reinforced with powdered bovine bones. It seeks to unveil the potential applications and advantages of this material across various domains such as economics, environmental conservation, mining, ecology, energy, and the enhancement of green energy policies. The research is anchored in the expertise of specialists who are deeply engaged powder. with bone cow Their investigations encompassed the production, characterization, and evaluation of the mechanical and tribological performance of composites reinforced with surfacemodified cow bone powder. It was discovered that salinization stands out as the optimal method for surface

modification, significantly improving the mechanical, thermal, and wear resistance properties. These composites exhibit enhanced performance over their unmodified counterparts in aspects such as glass transition temperature, crystallization, hardness, and tensile strength [1].

The study posits cow bone powder as an economically viable and environmentally friendly material for substituting a portion of cement in concrete.

Tests reveal that cow bone powder comprises nearly all the constituents of cement, albeit in different proportions.

It was observed that concrete's strength enhances with age, recording the highest average compressive strength at 28 days when cement is partially substituted with cow bone powder [2].

In comparing cow bone powder with demolished concrete within foam concrete, the study identified a significant impact on compressive strength, which increased at 18% and 20% replacements but declined at 25%.

This inclusion also introduces more air into the material, making it well-suited for lightweight construction applications. The study, while focused on concrete Panels, provides a foundation for future inquiries [3].

Cow bone, treated as bio-waste, has been transformed into an environmentally friendly and economically viable resource. This research utilized cow bone heads that were collected, cleaned, sun-dried, and milled into nanoparticle powder.

Various characterization techniques such as scanning electron microscopy (SEM), energy-dispersive X-ray spectroscopy (EDX), and X-ray fluorescence (XRF) were employed. Image processing techniques enhanced the visual quality and resolution of the final product [4].

Further exploring the utilization of waste materials, the study looked into the additive stabilization of highway lateritic soil with cow bone powder and plastic waste as sub-base materials. Soil samples classified under the CL group and A-6 material showed improved results with the introduction of hydrated lime, cow bone, and plastic waste, highlighting the composite's suitability for highway sub-base material [5]

A study comparing cow bone powder and demolished concrete in foam concrete revealed that cow bone powder significantly impacts compressive strength.

The research indicated that the compressive strength of foam concrete increased with 18% 20% and replacement levels but decreased at 25%. Incorporating cow bone powder also introduces more air into the making it for material. suitable lightweight partitioning.

The study's limitations are confined to concrete Panels; however, it could provide a basis for future research [6].

The research extends into the domain of agricultural waste management in Nigeria, demonstrating how pulverized cow bone ash and waste glass powder (PCBAWGP) enhance the compressive and tensile strength of concrete.

This sustainable method not only reduces CO2 emissions but also extends concrete's lifespan, presenting a viable alternative to Portland cement [7].

Addressing the global issue of bone waste, a bone powder miller was developed to convert cow bone waste into usable materials, thus contributing to waste reduction and sustainable agriculture [8]. The dielectric properties of composite materials from cow bone and carbonized waste were examined, highlighting the improved thermal stability and dielectric properties of carbonized particles [10].

The study further investigated cow bone powder's influence on the slurry suspension of retrograded rice starch for bone repair applications, noting optimized samples showed promising physical properties [11].

Investigations into the potential of waste cow bone and glass as partial cement substitutes in solid concrete bricks revealed that a mixture of beef bone powder and glass powder achieved optimal compressive strength, underscoring the material's environmental friendliness [12].

Additionally, the study ventured into the production of phosphate fertilizer from cow bone waste, highlighting its high P2O5 content and endorsing its chemical efficacy [13].

The sorption efficiency of waste cow bone powder (WCBP) for Pb2+ in aqueous solutions was evaluated, showcasing its potential as a remediation method for leadcontaminated media [15].

Another facet of the research explored the pozzolanic properties of

cow dung powder (C.D.P.) as a partial replacement cement in concrete finding production, that 20% a replacement met the strength requirements for lightweight concrete [16].

The effects of incorporating animal bone powder (ABP) as a cement substitute were scrutinized, with findings indicating a significant impact on the mechanical properties of concrete at varying dosages, advocating for an optimal dosage of 10% by weight for concrete mix production [18]

An optimum dosage of 10% by weight is recommended for the production of normal concrete mixes.

Construction industry experts in Ethiopia are endeavoring to enhance the quality and ease of use of materials in construction projects.

Nevertheless, the utilization of alternative materials, such as Ambo Sandstone Fine Aggregate (ASFA), has been limited due to the neglect of proper procedures.

According to Ethiopian standard specifications, quarry samples from SENKELE and ALELTU exhibited high silt content, surpassing 6%.

By removing the silt, the content was reduced to 5.3%, below the maximum allowed limit of 6%. Consequently, ASFA has been deemed suitable for use in concrete mix production and strength assessment. Priced at 140 ETB per cubic meter, Ambo Sandstone Fine Aggregate is more affordable than river sand. However, it is crucial to wash ASFA thoroughly before its use in construction projects to ensure optimal results [19].

Lastly, the study examined the suitability of Ambo Sandstone Fine Aggregate (ASFA) for concrete production, emphasizing the importance of silt removal and proper preparation for enhancing material quality and performance [20].

This comprehensive investigation, using both experimental methodologies, analytical and contributes significantly to the fields of and material science sustainable construction, offering novel insights into the utilization of cow bone powder and other waste materials in enhancing concrete's thermal and mechanical properties. The primary objective of this study is to develop a mathematical grounded model physics in to investigate the instability of a thin Panel reinforced with fine cow bone particles.

Additionally, the work aims to create a model that assists the field of civil engineering in addressing issues related to biomass concrete.

Furthermore, this research explores the thermal behavior of a novel concrete formulation, thereby contributing to advancements in construction materials.

1- Homogenization by Methods (FU and SHY)[21]

As previously stated in the introduction, the homogenization and the FU and SHY models have been addressed. The following formula determines all properties [21]:-

As previously stated in the introduction, the homogenization and the FU and SHY models have been addressed. The following formula determines all properties [21]:-

mi propensio	L 1
$E_H = \zeta_{C.B.P} E_{C.B.P} V_{C.B.P} + E_C V_C$	(1)
$\rho_H = \zeta_{C.B.P} \rho_{C.B.P} V_{C.B.P} + \rho_C V_C$	(1)
$\alpha_H = \zeta_{C.B.P} \alpha_{C.B.P} V_{C.B.P} + \alpha_C V_C$	(2)
$\lambda_H = \zeta_{C.B.P} \lambda_{C.B.P} V_{C.B.P} + \lambda_C V_C$	(2)
$V_{II} = \zeta_{C,B,B} V_{C,B,B} V_{C,B,B} + V_C V_C$	(3)
n - casa casa tasar t t	<u>\-</u> /

Where: $\zeta_{P.B.C}$ (the effectiveness of cow's bones powders).

 $0 \prec \zeta_{C.B.P} \prec 1 \qquad (4)$

Moreover, we employ the elasticity formula to ascertain the shear modulus. G_H :

 $G_H = \frac{E_H}{2(1 + \nu_H)}$ (5)

Knowing that the volume (Matrix plus reinforcement equal one):-

$V_C + V_{C.B.P} = 1$	(6)
-----------------------	-----

The effectiveness of reinforcement is determined by the ratio between the minimum and maximum diameters of Cow Bone Particles.

$$\zeta_{P.B.C} = \frac{D_{Min}}{D_{Max}} \tag{7}$$

When:-

 $\frac{D_{Min}}{D_{Min}} = \frac{950\,\mu m}{1000\,\mu m} = 0.95$ (8)

We show from the physics literature to address the problem of determining the critical buckling temperature, a key factor in the study of instability. By defining work and mechanical energy being a scalar quantity we aim for a quantitative characterization of the various forms of motion considered in physics.

The principle of conservation and transformation of energy states that within an isolated system, the total energy, regardless of its form, remains constant [26].

Other study focuses on designing and fabricating a gasifier to produce liquid fuel from plum seeds, specifically Spondias mombin.

The gasifier was constructed using materials selected for their thermal, mechanical, and physical properties.

Performance evaluations were conducted, revealing various parameters such as operating time, fuel combustion rate, and combustion zone temperature [27].

Other work investigates the incorporation of pulverized cow bone ash and waste glass powder (PCBAWGP) in concrete production, demonstrating that this method is sustainable, diminishes waste, and lowers CO2 emissions by reducing the Portland cement content required in cement production.

This strategy is especially advantageous in urban settings [28].

The experiments examined the utilization of burnt and crushed cow

bones (BCCB) as a partial substitute for fine aggregate in concrete.

The results indicated that BCCB acts as a retarder, leading to an increase in the water-cement ratio and compressive strength [29].

In other research investigates the production of phosphate fertilizer from cow bone waste in Indonesian slaughterhouses, concentrating on how the concentrations of phosphoric and sulfuric acid impact the quality of the fertilizer [30].

We will integrate and compare the experimental data with the Young's modulus using the developed law, alongside other empirical formulas, for calculating concrete's behavior at the ultimate limit state.

The study conducted by N. M. Ogarekpe et al. explored the use of burnt and crushed cow bones (BCCB) as a partial substitute for fine aggregate in concrete.

The findings revealed that BCCB acts as a retardant, leading to an increase in the water-cement ratio and a decrease in the average compressive strength, which falls below the recommended minimum strength [30].

Our research contrasts the Young's modulus values as specified in various standards, including the British

Standards Institution (BSI) [31], American Concrete Institute (ACI) guidelines [32], concrete in the limit state RBA 60 [33], BAEL 91/99 [34], and the Eurocode 2 (EC2) [35] and (BAEL80) [36]. We focus on the modulus of elasticity of secant concrete. which accounts for instantaneous deformation, comparing different across international it regulations as presented in Table 2. From Figures 1 and 2, it is observed that the modulus of elasticity, as determined by the FU SHY rule developed, allows us to conclude that this rule can provide a safety margin of 15%. This margin serves as an additional indicator for initiating studies through mathematical development, which aligns more closely with reality. All the thermoparameters mechanical exhibit a gradual decrease with a very slight reduction, maintaining the concrete's stress standard above 25 GPa.

Table 2: Secant modulus of elasticity ofconcrete (instantaneous deformation) Bythe different international regulations withthe effective modulus of elasticity (rule ofFU SHY).

М	EH [21]	sc28 [30]	EBS 1[31]	EACI [32]	ERBA60 [33]	EBAEL80 [36]	EBAEL91/99 [34]	EEC2 [35]

Figure 1. Secant modulus of elasticity of concrete (instantaneous deformation) By the different international regulations with the effective modulus of elasticity (rule of FUSHY)

Figure 2. Secant modulus of elasticity of concrete (instantaneous deformation) By the two rules (ACI and EC2), which are very close to the effective elasticity adopted by (The FU SHY rule)

We notice that each time the concentration of cow bone powder particles increases, there is a small decrease in the calculated instantaneous modulus of concrete. The European code standard for the calculation of concrete structures is the closest; thus, the American standard is noted successively as (EC2) and (ACI). So, the FU SHY rule is the closest to homogenizing the mechanical and thermal properties of this new type of concrete.

$E_{ij} = 5.6 * (\sigma_{28})^{0.5}$	[32]
$E_{ij} = 22000 * (\frac{\sigma_{28}}{10})^{0.3}$	[35]

We would like to highlight some of the work on homogenization that our research team has conducted at the laboratory (LSMAGCTP), such as:-

Benfrid and the team at LSMAGCTP explored the "Thermomechanical Analysis of Glass Powder Based Eco-concrete Panels: Limitations and Performance Evaluation."

This study examines the use of glass powder as an additive in concrete, utilizing Eshelby's model to determine composite properties and a higher-order shear deformation plate theory for simulation.

The analysis includes the effects of glass powder volume, geometric parameters, and thermal loading, highlighting challenges and suggesting alternative optimization approaches [38] .Benbakhti and al investigated "An Analytical Analysis of the Hydrostatic Bending to Design a Wastewater Treatment Plant Using a New Advanced Composite Material." In response to drought-induced water scarcity, this research focuses on enhancing WWTP structures with nano-tungsten particles in stainless steel. The study uses Mori-Tanaka's homogenization model to analyze hydrostatic bending performance, demonstrating significant improvements in flexural strength with increased tungsten content [39]. Mohammed Chatbi and team examined "Nano-Clay Platelet Integration for Enhanced Bending Performance of Concrete Beams Resting on Elastic Foundation: An Analytical Investigation." This paper explores the reinforcement of concrete beams with various clay nano-platelets using quasi-3D beam theory and Eshelby's model.

The study assesses the static behavior of beams, considering factors like nano-platelet type and volume, providing new insights into structural resistance improvements [40].

HARRET colleagues and studied "Modeling the Thermoelastic Bending of Ferric Oxide (Fe2O3) Nanoparticles-Enhanced RC Slabs." This research presents a refined shear deformation theory for concrete slabs reinforced with Fe2O3 nanoparticles. Using Eshelby's model, the study evaluates the effects of mechanical and thermal loads. showing 45% a reduction in transverse displacement under mechanical loading with Fe2O3 reinforcement [41].

2- The Thermal Buckling (Physicmathematical model to calculate thermal buckling)

The total energy is written as follows

 $W_{ToT} = W_C + W_P + W_T \tag{8}$

kinematic kinetic energy

 $W_C^C = \frac{1}{2} \int_V \rho v^2 dv \qquad (9)$

Rotational kinetic energy

 $W_{C}^{R} = \sum_{i=1}^{k} \left(\frac{m_{i} v_{i}^{2}}{2} + \frac{m_{i} (v_{i} - v_{c})^{2}}{2} \right)$ (10)

So, the overall kinetic energy is written $W_{c} = \frac{1}{2} \left(\frac{m^{2}}{2} + \frac{J\omega^{2}}{2}\right) \quad (11)$

Internal and external potential energy.

 $W_p = W_p^{out} + W_p^{\text{int}}$ (12)

For a homogeneous, isotropic and elastic body Linearly $\frac{-\frac{Elastic}{Dompic} W_{P} = \frac{dx^{2}}{2}}{(14)}$

Rotational

The rotation

The Gravity

 $g = -f \frac{M}{r^3} r \tag{17}$

The gravitational gradient is written. $\boxed{g = -grad\phi = -(\frac{\partial \varphi}{\partial x} i + \frac{\partial \varphi}{\partial y} j + \frac{\partial \varphi}{\partial z} k)}$ (18)

The second derivative of gravitational gradient is written

We recall that Laplacian is denoted as.

The angulation is defined as follows.

 $\varphi = -f \int_{V} \frac{\rho dV}{r} \tag{21}$

Potential Energy.

 $W_P = -f \frac{mM}{r} + mC \tag{22}$

Thermal Energy

 $W_T = \frac{1}{2} \int_v \phi dv = \int Q dT = \frac{1}{2\Delta T} \int_{T_1}^{T_2} \overline{C} dT \qquad (23)$

Total energy applied to the body (Variation virtual).

 $\delta W_{ToT} = \delta W_C + \delta W_P + \delta W_T \qquad (24)$

Other writing.

 $\delta W_{ToT} = \frac{1}{2} \int_{V} \delta \rho v^{2} dv + \frac{1}{2} \int_{V} \delta \omega_{\rho} dv + \frac{1}{2} \int_{V} \delta \phi dv \qquad (25)$

The variation of total energy compared to an effective time.

 $\frac{\partial W_{T_{0}T}}{\partial t} = 0 \tag{26}$

In energy conservation the derivative of total is equal to zero. $\frac{\left[\frac{c(\frac{1}{2}\int_{r} \rho v^{2} dv + \frac{1}{2}\int_{r} \phi_{r} dv + \frac{1}{2}\int_{r} \phi dv\right]}{\left[\frac{c(\frac{1}{2}\int_{r} \rho v^{2} dv + \frac{1}{2}\int_{r} \phi dv + \frac{1}{2}\int_{r} \phi dv\right]}{\left[\frac{c(\frac{1}{2}\int_{r} \rho v^{2} dv + \frac{1}{2}\int_{r} \phi dv + \frac{1}{2}\int_{r} \phi dv\right]}{\left[\frac{c(\frac{1}{2}\int_{r} \rho v^{2} dv + \frac{1}{2}\int_{r} \phi dv + \frac{$

For a surface element of a body, the sliding force is written. $\delta A = Fdr = Fds \cos \alpha = F, ds$ (28)

3- The comparison or validation of the Thermal buckling (Physicmathematical model to calculate thermal buckling)

After carrying out the calculation algorithm with MAPLE 13, we need to compare our findings with those from other research, such as the study on the thermal buckling of a concrete Panelwith simple supports conducted by CHENG X-s [37]. The comparison is detailed in Table 4. It's important to note that S.D. represents simple deflection method the employed by CHENG X-s [37] for conditions where $a_{th}=10^{-5}$ °C and *n*=1/6 and *E* =25 *GPa*. C.P.T stands for Classical PanelTheory, F.S.D.T the First-Order Shear represents Deformation Theory with a correction coefficient for estimating the shear coefficient. Lastly, H.S.D.T is the Higher-Order Shear Deformation Theory where shear is evaluated through a function dependent on the

thickness h and the function for z, as shown in Table 3.

Table 3. The calculation functions forthermal buckling in this work

0				
Function	S.D	C.P.T	F.S.D.T	H.S.D.T
f(z)	-	-	Z	Eq (67)
g(z)	-	-	$k = \frac{5}{6 - \vartheta^2}$	Eq (68)

Table 4. Comparison of calculations by themodel created and the results of CHENG

X-s [37]				
Function	S.D[37]	C.P.T	F.S.D.T	H.S.D.T
b = 1 * a; a = 30 * h	156.6	159.03	158.53	158.96
b=3*a;a=30*h	87.1	88.45	88.21	88.33
b = 1 * a; a = 40 * h	88.1	49.45	89.31	89.43
b = 3 * a; a = 40 * h	48.9	49.69	49.66	49.69

The results of the selected parameters are in alignment with those reported by CHENG. This study focuses on exploring variations in Panelgeometry and adjustments in reinforcement through the incorporation of cow bone powder at concentrations of 10%, 20%, and 30%.

* Results and discussions

We initiated the calculation of the critical temperature leading to instability induced by thermal flame, subsequent confirming to and validating the arithmetic programming, as indicated in Table 4. Initially, our investigation focused solely on ordinary concrete. Then, with each iteration, we augmented the concentration of cow bone particles. The results for ordinary concrete are presented in Table 5, while those for

concentrations of 10%, 20%, and 30% of cow bone powder or fine particles are provided in Tables 6, 7, and 8, respectively. We observe that an increase in two geometric ratios leads reduction in the critical a to temperature, resulting in thermal instability. The first ratio is the widthto-length ratio (b/a), and the second is the length-to-thickness ratio (**a**/**h**).

On the other hand, we notice that the discrepancy among the three Paneltheories is minor, possibly attributed to the Panelbeing extremely thin or not very thick. Bone powder exerts a favourable impact on thermal instability by lowering the temperature This at which buckling initiates. signifies a notable advancement in civil engineering, as the thermal resistance enhances with the introduction of this novel concrete derived from bovine waste. When calculating the ratio of the critical temperature of each successive large volume fraction to the preceding one, we discover a consistent coefficient, approximately equal to 0.93. The most favourable outcomes are achieved with the **30%** cow powder fraction. Since this addition constitutes a BioSource material, we are constrained from exceeding 30% of such materials.

Table 5. The results of the critical buckling temperature D_{Tcr} of ordinary concrete noted

Table 7. The results of the critical bucklingtemperature DT_{cr} of ordinary concretereinforced by 20% with cow bone powder

Table 8. The results of the critical bucklingtemperature DT_{cr} of ordinary concretereinforced by 30% with cow bone powder

* Conclusion

At the conclusion of this study, we can draw the following conclusions:-

1- The optimal volume fraction or concentration of cow bone powder

(cow bone particles) yielding favorable results is 30%.

2- This technique enhances the field of civil engineering by introducing ecoconcrete, which improves resistance to thermal buckling, thereby promoting energy efficiency in buildings.

3- Cow bone particles have the potential to replace portions of cement in concrete.

4- Reusing cow bones in cement or production concrete offers environmental benefits, given that many countries discard bones from Therefore, processing. this meat concrete can be considered environmentally friendly (ecofriendly).

5- Pozzolanic additives like this powder can reduce **CO**₂ emissions and heat from cement plants, providing economic advantages alongside environmental benefits.

* Andex

It is important to observe that:

C: Concrete.

C.B.P: Cow bone powder

 V_C : Volume of concrete [%].

V_{C.B.P}: Volume Cow bone powder [%].

E: Modulus of elasticity [GPa].

G: Shear's Modulus [GPa].

- *a*:Thermal's ratio[$^{\circ}C^{-1}$].
- ρ : Density [kg m⁻³].

n:Poisson's ratio.

l: Thermal conductivity [W m⁻¹ K⁻¹].

Z: The effectiveness of reinforcement is determined by the ratio between the minimum and maximum diameters of Cow Bone Particles.

D: Diameter of particle.

- **D**_{Max}: maximum diameter of Cow Bone Particles.
- *D_{Min}*: minimum diameter of Cow Bone Particles.

M: Materials.

Eq 01 :

 $E_H = \zeta_{C.B.P} E_{C.B.P} V_{C.B.P} + E_C V_C$

 σ_{28} : the stress of compression at the age of 28 days.

BSI: $E_{ij} = 9100 * (\sigma_{28})^{0.33}$ **ACI:** $E_{ij} = 5.6 * (\sigma_{28})^{0.5}$ **RBA60:** $E_{ij} = 7000 * (\sqrt{\sigma_{28}})$ **BAEL80:** $E_{ij} = 12000 * (\sigma_{28})^{\frac{1}{3}}$ **BAEL91/99:** $E_{ij} = 11000 * (\sigma_{28})^{\frac{1}{3}}$ **EC2:** $E_{ij} = 22000 * (\frac{\sigma_{28}}{10})^{0.3}$ *a:* the length of the plate. *b:* the width of the plate. *h:* the thickness of the plate.
